

Wireless Access Control System

Convenient
Secure
Via radio

Fully integrated, no wires

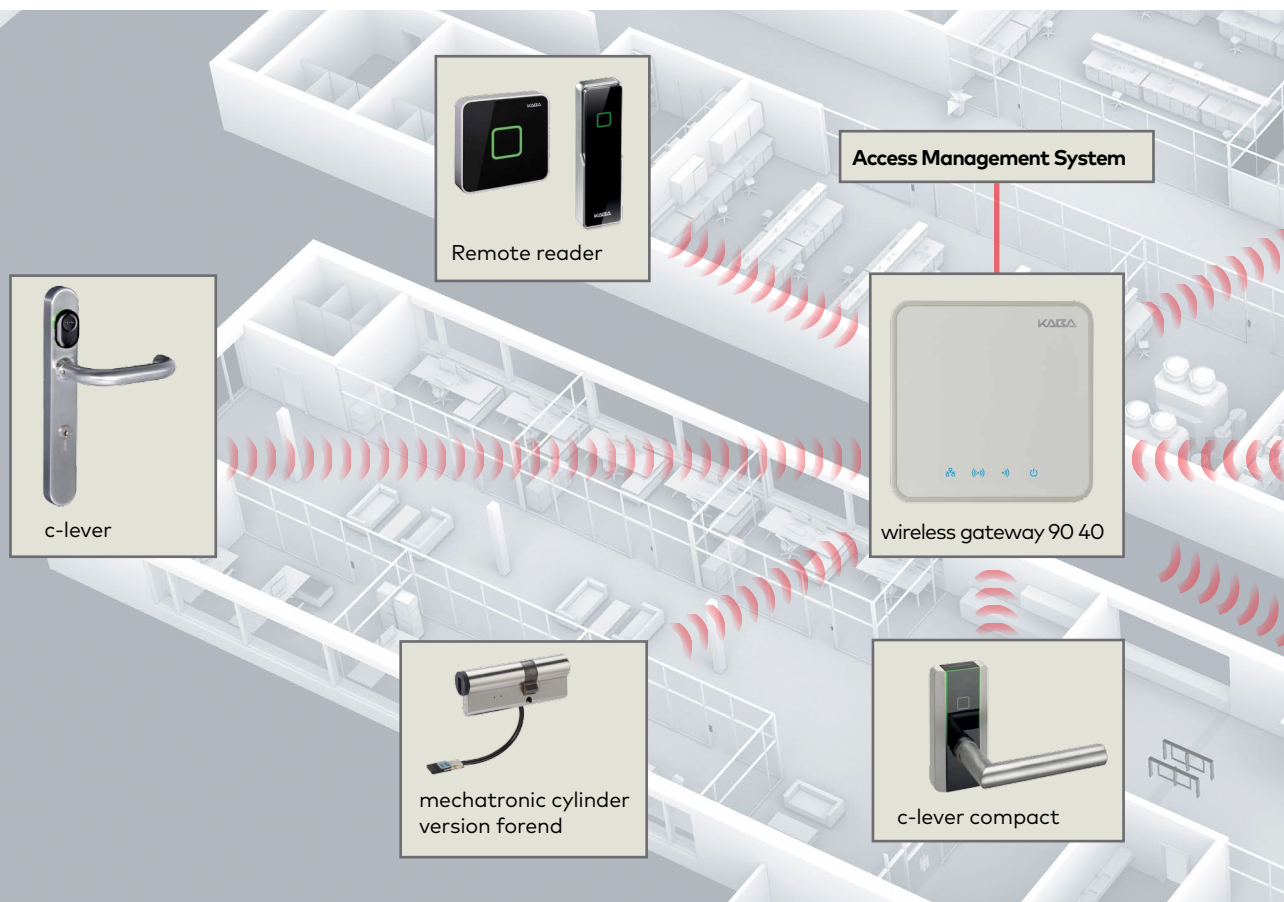

Wireless technology has made our lives easier in many respects – from surfing over WLAN to mobile telephony. Wireless technology also offers substantial benefits for access solutions with unwired doors: You see in real time what is happening at the door, and the door immediately knows who may enter and who not.

Let's assume that you wish to install an electronic locking system in a building without having to affect the historic building. Or you would like to administer and monitor a remotely located door. The solution is simple: you can integrate unwired access components directly and conveniently into your overall system.

Combined with readers and standalone components, the wireless solution is the perfect match. You get your individual and customised solution for every door. You can extend or install new access solutions quick, easy and cost-efficiently.

The ideal combination for enhanced economic efficiency

Wireless access components offer you double benefit: on the one hand, you get a straightforward wireless installation, and on the other hand, you can change access rights within seconds, while sitting comfortably at your desk. You grant access rights quickly and easily, on-site programming is no longer required. You always have access to information on the current door status and all door events, firmware updates are transmitted wirelessly to the doors. This ensures better maintenance planning. Or, to put it simply: you need less time and achieve more security.

Security comes first

Our wireless solutions ensure more security: so if badges are lost or stolen you can use the wireless system to revoke access rights from those media. If a door is broken open, your administrator will receive immediate notification*. In addition, communication between wireless components and the access management system is encrypted, so there is no risk of manipulation.

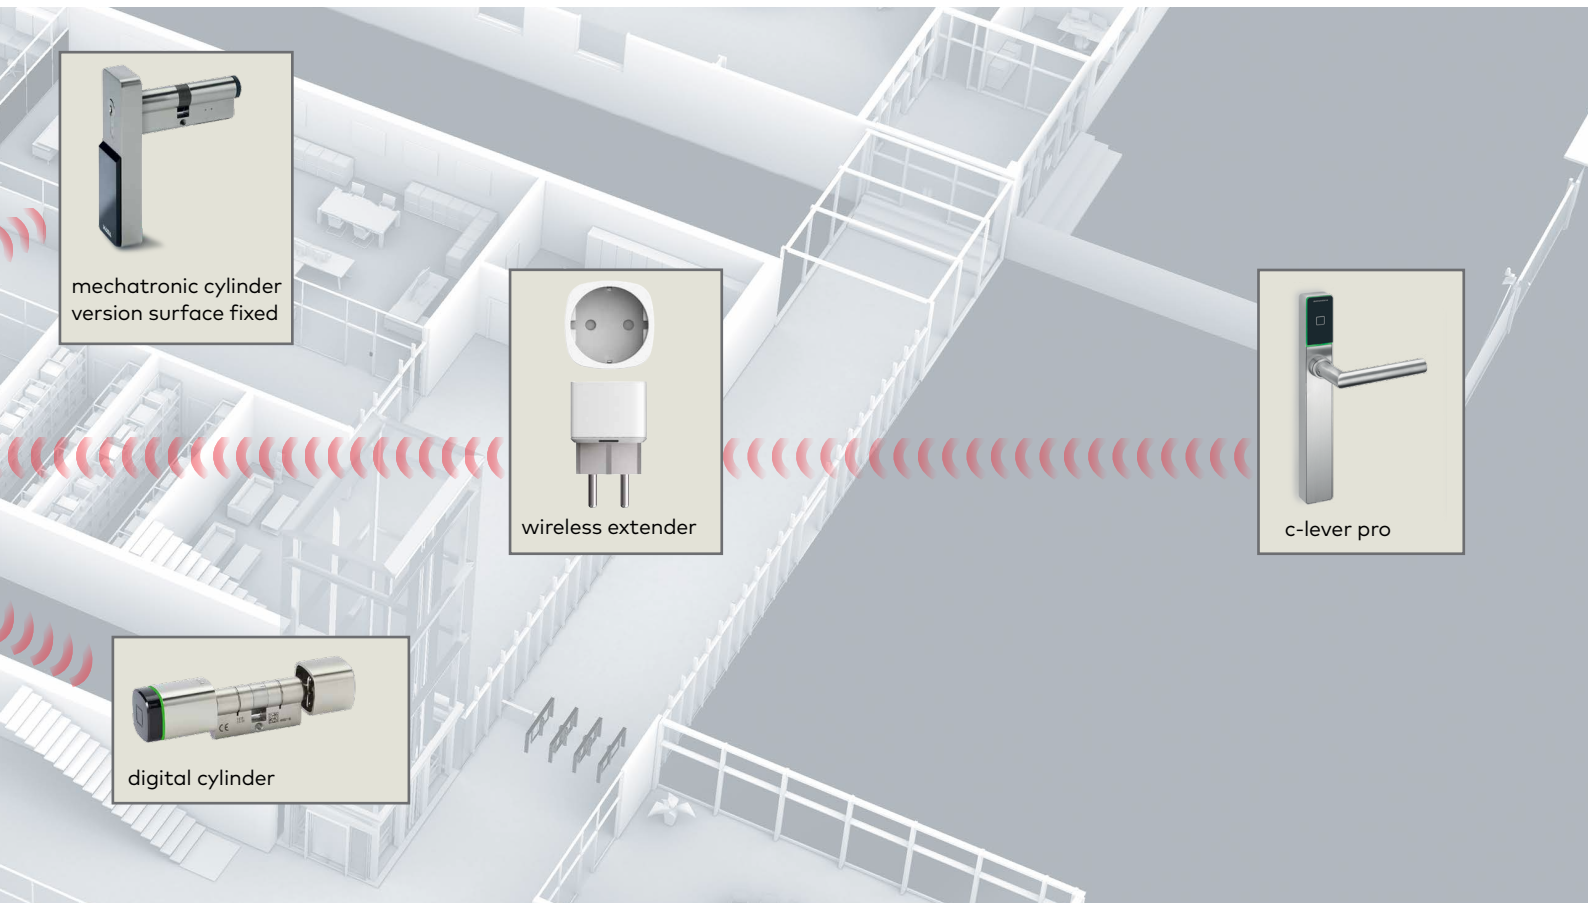

Key wireless functions

- You assign access rights with ease
- You are always informed about door status and access events*
- An alarm* is triggered if a door is broken open
- You can update firmware easily
- You open and close doors by remote control*
- Communication is encrypted
- You automatically get notified about battery status

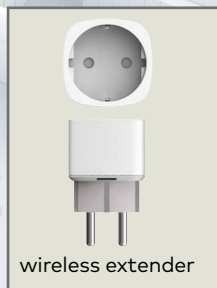

Your benefits

- Enhanced security for isolated doors thanks to direct wireless transmission
- Administrative effort is reduced as on-site programming is eliminated
- Existing system solutions can be easily extended
- You can even network access points where wiring is not an option
- You increase convenience thanks to prompt maintenance information

Access authorisations - the easy way

Access rights of employees can be easily managed by human resources department. Just as easy, current status info can be requested or individual doors monitored.

Convenient wireless function

Quick and safe granting of visitor access rights can be handled by the reception. Badges that have not been returned are not a problem: authorisations are quickly revoked by the wireless system.
